

Multiplying of Integers

Write each of the repeated additions as multiplication:

$$\Rightarrow (+2) + (+2) + (+2) + (+2) + (+2) = \underline{\hspace{2cm}}$$

$$\Rightarrow (-6) + (-6) + (-6) = \underline{\hspace{2cm}}$$

Write each of the multiplications as a repeated addition.

$$\Rightarrow (+2) \times (+5) = \underline{\hspace{3cm}}$$

$$\Rightarrow (6) \times (-3) = \underline{\hspace{3cm}}$$

Do these two methods mean the same thing? Is there a difference between these expressions and the previous ones? Let's Draw a picture!

Write each of the following array diagrams as a repeated addition and as a multiplication statement.

Ways of Showing Multiplication

$\Rightarrow (a \times b) \rightarrow$ Cross-Product

$\Rightarrow (a \cdot b) \rightarrow$ Dot Product

$\Rightarrow (a)(b) \rightarrow$ Brackets

$\Rightarrow a(b) \rightarrow$ Coefficient

Tip: when writing negative numbers place the number and negative sign in brackets, to prevent any confusion.

Example: $4 -3$ or $(4) -3$ or $(4)(-3)$ etc....

Complete the following:

a) $(+4) \times (+6) = \underline{\hspace{2cm}}$

b) $(-1) \times (+2) = \underline{\hspace{2cm}}$

c) $(-2) \times (-3) = \underline{\hspace{2cm}}$

d) $4 \cdot 5 \cdot (-1) = \underline{\hspace{2cm}}$

e) $(10)(-2)(-1) = \underline{\hspace{2cm}}$

f) $(-4) \cdot (-3) \times (2) = \underline{\hspace{2cm}}$

Dividing of Integers

Division undoes multiplication. With division, we take a collection of items and divide them amongst certain number groups and we determine how many items are in each group.

Example: write $4 \times 3 = 12$ as a division statement

Ways of Showing Division

$\Rightarrow (a \overline{) b} \rightarrow$ Long Division (Vinculum Notation)

$\Rightarrow (a \div b) \rightarrow$ Obelus Sign

$\Rightarrow (a / b) \rightarrow$ Fraction Notation

Complete the following:

a) $(-12) \div (-3) = \underline{\hspace{2cm}}$

b) $(-976) \div (8) = \underline{\hspace{2cm}}$

c) $(0) \div (576) = \underline{\hspace{2cm}}$

d) $(-20) / (-5) = \underline{\hspace{2cm}}$

e) $(16) / (4) = \underline{\hspace{2cm}}$

f) $(-4) / (0) = \underline{\hspace{2cm}}$

Sign Rule (Multiplying & Dividing ONLY)

If a and b are natural numbers then,

$$a \times b =$$

$$(-a) \times (-b) =$$

$$a \times (-b) =$$

$$(-a) \times b =$$

In general, if there is an *odd* number of negative (-) signs then the answer will be *negative* (-). If there is an *even* number of negative (-) signs then the answer will be *positive* (+).
