

Factors

Express 28 as a product of two natural numbers.

$$\Rightarrow 28 = \underline{2 \times 14}$$

$$\Rightarrow 28 = \underline{4 \times 7}$$

$$\Rightarrow 28 = \underline{1 \times 28}$$

We can also say 28 can be exactly divided by 1, 2, 4, 7, 14, 28

A FACTOR is a number that, when multiplied with another number, produces a given product.

Therefore, the factors of 28 are 1, 2, 4, 7, 14, 28

What are the factors for 36? 1, 2, 3, 4, 6, 9, 12, 18, 36

Divisibility Test:

1. A number is divisible by 2 if its Last digit is Even

Example: 2, 4, 6, 8, ..., 20, 22, ..., 98, 100, ...

2. A number is divisible by 3 if the Sum of its digits is also divisible by 3

Example: 3, 6, 9, 18, 21, 27, 36, 42, 51, 102, 111, 132, 195, ...

3. A number is divisible by 5 if its Last digit is either 0 or 5

Example: 5, 10, 15, 20, 50, 55, 85, 105, 140, ...

4. A number is divisible by 10 if its Last digit is 0

Example: 10, 20, 50, 70, 110, 140, 160, 170, ...

Multiples:

28 is a multiple of 4 and 7.

The first few multiples of 4 are:

$$\Rightarrow 4 \times 1 = 4$$

$$\Rightarrow 4 \times \underline{2} = \underline{8}$$

$$\Rightarrow 4 \times \underline{3} = \underline{12}$$

$$\Rightarrow 4 \times \underline{4} = \underline{16}$$

$$\Rightarrow 4 \times \underline{5} = \underline{20}$$

The first few multiples of 7 are:

$$\Rightarrow 7 \times 1 = 7$$

$$\Rightarrow 7 \times \underline{2} = \underline{14}$$

$$\Rightarrow 7 \times \underline{3} = \underline{21}$$

$$\Rightarrow 7 \times \underline{4} = \underline{28}$$

$$\Rightarrow 7 \times \underline{5} = \underline{35}$$

Relationships of $28 = 4 \times 7$

$\Rightarrow 4$ is a factor of 28.

$\Rightarrow 28$ is a multiple of 4.

$\Rightarrow 7$ is a factor of 28.

$\Rightarrow 28$ is a multiple of 7.

Prime Factorization:

Consider the number 60. It is a **composite** number as it can be written as a product of 2 or more other numbers ($60 = 6 \times 10, 2 \times 30, 3 \times 20, 4 \times 15$, etc.)

If we break down a composite number and its factors until there are no more factors, we end up with a number made **only from prime numbers** ($60 = 2 \times 2 \times 3 \times 5$).

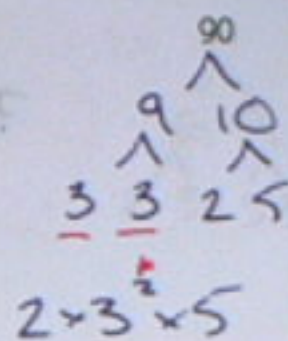

\Rightarrow When a number is written as a **Product of Prime Numbers** we call this a **Prime Factorization**.

Recall: Prime numbers are special numbers that have exactly two factors: 1 and the number itself (i.e. they are only divisible by 1 and themselves).

Common Prime #'s: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, ...

Example: Using a factor tree determine the Prime Factors of the following numbers? Express your answer in exponential form.

The Greatest Common Factor (GCF)

Let's find all the factors 18 and 24 as follows:

$$\Rightarrow 18: \underline{1, 2, 3, 6, 9, 18}$$

$$\Rightarrow 24: \underline{1, 2, 3, 4, 6, 8, 12, 24}$$

What are the common factors between 18 and 24? 1, 2, 3, 6

What would be the greatest (i.e. biggest/largest) common factor? GCF (18, 24) 6

The Greatest Common Factor is the largest factor that is the same (i.e. common) between a set of numbers.

OR

The largest number that can be divided evenly into all the numbers.

This method can be tricky and take a lot of time. Alternatively, we can use *Prime Factorization* to help us find the GCF.

The GCF can be found by identifying **ALL** the Prime Factors **common** between the set of numbers and multiplying them together.

Example: Find the Prime Factors for the following pairs of numbers using a factor tree, then find the GCF

The Prime Factors of 35 and 42 are

$$\Rightarrow 35: \underline{5, 7}$$

$$\Rightarrow 42: \underline{2, 3, 7}$$

$$\Rightarrow \text{GCF} = \underline{7}$$

The Prime Factors of 60 and 90 are:

$$\Rightarrow 60: \underline{2^2 \times 3 \times 5} \text{ or } \underline{2 \times 2 \times 3 \times 5}$$

$$\Rightarrow 96: \underline{2^5 \times 3} \text{ or } \underline{2 \times 2 \times 2 \times 2 \times 2 \times 3}$$

$$\Rightarrow \text{GCF} = \underline{2 \times 2 \times 3 = 12}$$

Example: Find the Prime Factors for the following set of numbers using a factor tree, then find the GCF

The Prime Factors of 36, 54 and 72 are:

$$\Rightarrow 36: 2 \times 2 \times 3 \times 3$$

$$\Rightarrow 54: 2 \times 3 \times 3 \times 3$$

$$\Rightarrow 72: 2 \times 2 \times 2 \times 3 \times 3$$

$$\Rightarrow \text{GCF} = 2 \times 3 \times 3 = 18$$

The Prime Factors of 24, 48 and 60 are:

$$\Rightarrow 24: 2 \times 2 \times 2 \times 3$$

$$\Rightarrow 48: 2 \times 2 \times 2 \times 2 \times 3$$

$$\Rightarrow 60: 2 \times 2 \times 3 \times 5$$

$$\Rightarrow \text{GCF} = 2 \times 2 \times 3 = 12$$

Lesson 4 Lowest Common Multiple (LCM)

Let us consider the following multiples of 12 and 18.

$$\Rightarrow 12 \quad 24, 36, 48, 60, 72, 84, 96, 108, 120, 132, 144$$

$$\Rightarrow 18 \quad 36, 54, 72, 90, 108, 126, 144$$

The common multiples between 12 and 18 include: $36, 108, 144$

What is the lowest common multiple between 12 and 18? LCM (12, 18) = 36

The Lowest Common Multiple is the smallest number that is a multiple of each of the given numbers.

Again, this method can be tricky and take a lot of time. Alternatively, we can use *Prime Factorization* to help us find the LCM.

Example: Find the Prime Factors for 12 and 18

The Prime Factors of 12 and 18 are:

$$\Rightarrow 12 \quad 2 \times 2 \times 3 \quad \text{Exponential Form: } 2^2 \times 3$$

$$\Rightarrow 18 \quad 2 \times 3 \times 3 \quad \text{Exponential Form: } 2 \times 3^2$$

The LCM can be found by identifying *ALL* the prime factors of each number in *exponential form* and then multiplying the *highest powers* for each of the prime factors.

$$\Rightarrow \text{Prime Factors: } 2^2 \times 3 \quad // \quad 2 \times 3^2$$

$$\Rightarrow \text{LCM} = 2^2 \times 3^2 = 4 \times 9 = 36$$

Example: Find the LCM between 30 and 42

$$\begin{array}{c}
 30 \\
 \wedge \\
 3 \quad 10 \\
 \quad \wedge \\
 \quad \quad 2 \quad 5 \\
 \underline{2 \times 3 \times 5}
 \end{array}$$

$$\begin{array}{c}
 42 \\
 \wedge \\
 6 \quad 7 \\
 \quad \wedge \\
 \quad \quad 2 \quad 3 \\
 \underline{2 \times 3 \times 7}
 \end{array}$$

$$LCM = 2 \times 3 \times 5 \times 7 = 210$$

Example: Find the LCM between 20, 35, and 45.

$$\begin{array}{c}
 20 \\
 \wedge \\
 2 \quad 10 \\
 \quad \wedge \\
 \quad \quad 2 \quad 5 \\
 \underline{2 \times 2 \times 5}
 \end{array}$$

$$\begin{array}{c}
 35 \\
 \wedge \\
 5 \quad 7 \\
 \underline{5 \times 7}
 \end{array}$$

$$\begin{array}{c}
 45 \\
 \wedge \\
 5 \quad 9 \\
 \quad \quad \wedge \\
 \quad \quad \quad 3 \quad 3 \\
 \underline{3 \times 3 \times 5}
 \end{array}$$

$$LCM = 2^2 \times 3^2 \times 5 \times 7 = 1260$$

Example: Find the LCM between 36, 48, and 60.

$$\begin{array}{c}
 36 \\
 \wedge \\
 6 \quad 6 \\
 \quad \wedge \quad \wedge \\
 \quad \quad 2 \quad 3 \quad 2 \quad 3 \\
 \underline{2^2 \times 3^2}
 \end{array}$$

$$\begin{array}{c}
 48 \\
 \wedge \\
 4 \quad 12 \\
 \quad \wedge \quad \wedge \\
 \quad \quad 2 \quad 2 \quad 3 \quad 4 \\
 \quad \quad \quad \quad \quad \wedge \\
 \quad \quad \quad \quad \quad \quad 2 \quad 2 \\
 \underline{2^4 \times 3}
 \end{array}$$

$$\begin{array}{c}
 60 \\
 \wedge \\
 6 \quad 10 \\
 \quad \wedge \quad \wedge \\
 \quad \quad 2 \quad 3 \quad 2 \quad 5 \\
 \underline{2^2 \times 3 \times 5}
 \end{array}$$

$$LCM = 2^4 \times 3^2 \times 5 = 720$$
