

## Factoring using Decomposition ( $ax^2 + bx + c$ )

Suppose your trinomial has a number in front of the  $x^2$  (that is NOT a GCF)  
Then this number needs to be part of the expansion and part of the brackets

We use a method called **factoring by decomp** to handle this

$$2x^2 + 9x - 5$$

$$2x^2 + 10x - 1x - 5$$

$$2x(x + 5) - 1(x + 5)$$

Answer:  $(x + 5)(2x - 1)$

**Step 1:** multiply first and last ( $2 \times 5$ )

**Step 2:** find 2 numbers that multiply to this and add to middle (in this case  $10 \times 1$ )

**Step 3:** decompose the middle term using these 2 numbers

(notice I still put the big # first)

**Step 4:** factor GCF from first 2 and last 2 terms

(notice ... if the brackets are the same you did it correctly)

**Step 5:** factor new GCF and state answer

It looks like a lot of work ... but the built-in check step makes it worth the effort ...

Factor the following

a)  $9x^2 - 15x + 4$

$$36$$

$12 \times 3$  works

$$9x^2 - 12x - 3x + 4$$

$$3x(3x - 4) - 1(3x - 4)$$

Answer:  $(3x - 4)(3x - 1)$

b)  $8x^2 - 10x - 3$

$$24$$

$12 \times 2$  works

$$8x^2 - 12x + 2x - 3$$

$$4x(2x - 3) + 1(2x - 3)$$

Answer:  $(2x - 3)(4x + 1)$

c)  $18x^2 - 7x - 1$

$$18$$

$9 \times 2$  works

$$18x^2 - 9x + 2x - 1$$

$$9x(2x - 1) + 1(2x - 1)$$

Answer:  $(2x - 1)(9x + 1)$

10)  $24x^2 - xy - 3y^2$

$$72$$

$9 \times 8$  works

$$24x^2 - 9xy + 8xy - 3y^2$$

$$3x(8x - 3y) + y(8x - 3y)$$

Notice  $xy$  middle terms

Answer:  $(8x - 3y)(3x + y)$
